Pre-requisites/Exposure	Basic knowledge Mathematics and data structure	] 。			
Co-requisites					

#### Course Objectives

- To understand the necessity of the algorithm design.
  - 2. To write the algorithm to solve a problem.
- 3. To analyze the performance of the algorithm.
  - 4. To implement the algorithm in C/C++.

#### Course Outcomes

On completion of this course, the students will be able to

- CO1. Apply mathematical techniques to find the complexity of an algorithm.
  - CO2. Analyze algorithms and express asymptotically different case behavior.
    - co3. Demonstrate good principles of algorithm designs.
- CO4. Design appreciate data structures to reduce the complexity of an algorithm.
  - CO5. Differentiate among P, NP Hard and NP Complete problems.

#### Catalog Description

The broad focus lies on computational complexity, divide-and-conquer approach, dynamic programing, greedy approach and backtracking algorithms. The clear distinction among P, NP Hard and NP Complete This course deals with various aspects of designing algorithms and their mathematical characteristics. problems are covered in detail.

#### **Course Content**

#### UNIT I:

Introduction

#### 9 Lecture Hours

B.TECH (CSE) with Specialization in Specialization in DevOps

Page 85 of 138

2022-23 Batch Algorithm, Psuedo code, Performance Analysis- Space complexity, Time complexity, Asymptotic Notation-Big oh notation, Omega notation, Theta notation with numerical, different algorithm design techniques, recurrence relation, solving methods: substitution, recursion tree, master theorem with numerical.

#### Divide And Conquer

#### 6 Lecture Hours

Binary search, Quick sort: best case & worst case analysis, Merge sort, Strassen's matrix multiplication

#### UNIT III:

Greedy Method

#### 6 Lecture Hours

Activity selection problem, knapsack problem, Minimum cost spanning trees: Prims and kruskal, Single source shortest path problem: Bellman ford, dijkstra's, Huffman codes.

#### VI TINO

#### DYNAMIC PROGRAMMING

#### 5 Lecture Hours

Matrix chain multiplication, 0/1 knapsack problem, All pairs shortest path problem, largest common subsequence.

#### V TINO

#### Sorting In Linear Time

#### 6 Lecture Hours

Lower Bounds For Sorting, Counting Sort, Radix Sort, bucket sort

Backtracking: N-queen problem, sum of subsets problem

#### IN LINO

### Branch and Bound Method And Its Applications

4 Lecture Hours

Travelling salesman problem

NP-Hard and NP-Complete problem and concepts

#### Course Objectives

- f 1. Learn how to analyze a problem and design the solution for the problem.
  - $2.\;\;$  Design and implement efficient algorithms for a specified application.
- Strengthen the ability to identify the suitable data structure and design strategy for the given real world problem.

#### Course Outcomes

Upon completion of this course the learners will be able to:

- CO1. To learn the importance of designing an algorithm in an effective way by considering space and time complexity
- CO2. Apply divide and conquer strategy based algorithms.
- CO3. Apply Greedy and Dynamic Programming designing approach to problem solution
- CO4. Application of Backtracking and brand and bound strategies over different problems

#### Catalog Description

followed. Some of them can be efficient with respect to time consumption, whereas other approaches may be memory efficient. However, one has to keep in mind that both time consumption and memory The important aspects of algorithm design include creating an efficient algorithm to solve a problem in an efficient way using minimum time and space. To solve a problem, different approaches can be usage cannot be optimized simultaneously.

#### List of Experiments

### Experiment-1: Brute Force Techniques

1. Sort a given set of elements using bubble and selection sort and hence find the time required to sort elements

B.TECH (CSE) with Specialization in Specialization in DevOps

- 2022-23 Batch
- 2. Perform linear search and find the time required to search an element.
- 3. Given a string called TEXT with 'n' characters and another string called PATTERN with 'm' characters (m<=n) .Write a program which implements brute force string matching to search for a given pattern in the text. If the pattern is present then find the position of first occurrences of Pattern in that Text.

### Experiment-2: Divide and Conquer-I

- Implement Binary search and linear search and determine the time required to search an element. Repeat the experiment for different values of n, the number of elements in the list to be searched and plot a graph of the time taken versus n.
- Search a elements using the Binary search method and determine the time required
  to search the element. Repeat the experiment for different values of n, to search for
  the element in the list and plot a graph of the time taken versus n.
- Sort a given set of elements using the Merge Sort algorithm to sort a given set of Repeat the and plot a graph of the time taken versus n. The elements can be read from a file or experiment for different values of n, the number of elements in the list to be sorted elements and determine the time required to sort the elements. can be generated using the random number generator. က

### Experiment-3: Divide and Conquer-II

- 1. Sort a given set of elements using the Quicksort method and determine the time required to sort the elements. Repeat the experiment for different values of n, the number of elements in the list to be sorted and plot a graph of the time taken versus n. The elements can be read from a file or can be generated using the random number
- Sort a given set of elements using the insertion Sort algorithm to sort a given set of elements and determine the time required to sort the elements. Repeat the experiment for different values of n, the number of elements in the list to be sorted and plot a graph of the time taken versus n. The elements can be read from a file or can be generated using the random number generator. ď

B.TECH (CSE) with Specialization in Specialization in DevOps

Page 109 of 138

2022-23 Batch Implement Strassen's matrix multiplication and compare the complexity with normal matrix multiplication

### EXPERIMENT-4: Title: GREEDY METHODS-I

1. Implement the activity-selection problem (You are given n activities with their start and finish times. Select the maximum number of activities that can be performed by a single person, assuming that a person can only work on a single activity at a time. Example: Consider the following 6 activities.

Start [] =  $\{1, 3, 0, 5, 8, 5\}$ ; finish [] =  $\{2, 4, 6, 7, 9, 9\}$ ;

The maximum set of activities that can be executed by a single person is {0, 1, 3, 4}).

- an earliest start time si, and a processing time pi. We consider a preemptive version 3, then a legal preemptive schedule is one in which job 2 runs from time 0 to 2 and is from time 7 to 8. The goal is to output a schedule that minimizes  $\Sigma Cj = 1$ , where Cj is the time when job j is completed and j runs from  $1\,\mathrm{to}$  n. In the example schedule given of the problem where a job's execution can be suspended at any time and then completed later. For example if n = 2 and the input is s1 = 2, p1 = 5 and s2 = 0, p2 =then suspended. Then job 1 runs from time 2 to 7 and secondly, job 2 is completed Consider the following scheduling problem. You are given n jobs. Job i is specified by above, C1 =7 and C2=8.  $\dot{\varsigma}$
- 3. To find Optimal solution for a Knapsack Problem using Greedy Method
- 4. Implement the file or code compression using Huffman's algorithm.

### EXPERIMENT-5: Title: GREEDY METHODS-II

- 1. To find Optimal solution for a Knapsack Problem using Greedy Method
- 2. Implement the file or code compression using Huffman's algorithm.

### EXPERIMENT-6: Title: Graph Algorithms-I

1. Find Minimum Cost Spanning Tree of a given undirected graph using Kruskal's

algorithm B.TECH (CSE) with Specialization in DevOps This document is the Intellectual Property of University of Petroleum & Energy Studies and its contents are protected under the 'Intellectual Property Rights'.

Page 110 of 138

- 2022-23 Batch 2. Find Minimum Cost Spanning Tree of a given undirected graph using prim's algorithm
  - 3. From a given vertex in a weighted connected graph, find shortest paths to other vertices using Dijkstra's algorithm
- 4. From a given vertex in a weighted connected graph, find shortest paths to other vertices negative weights (using Bellman-Ford algorithm).
- 5. Print all the nodes reachable from a given starting node in a digraph using BFS method. Check whether a given graph is connected or not using DFS method.

### EXPERIMENT-7: Title: Graph Algorithms-II

- 1. Find Minimum Cost Spanning Tree of a given undirected graph using Kruskal's algorithm
- 2. Find Minimum Cost Spanning Tree of a given undirected graph using prim's algorithm
- 3. From a given vertex in a weighted connected graph, find shortest paths to other vertices using Dijkstra's algorithm
- 4. From a given vertex in a weighted connected graph, find shortest paths to other vertices negative weights (using Bellman-Ford algorithm).
- 5. Print all the nodes reachable from a given starting node in a digraph using BFS method. Check whether a given graph is connected or not using DFS method.

## EXPERIMENT-8 Title: DYNAMIC PROGRAMMING-I

- 1. Implement 0/1 Knapsack problem using Dynamic Programming
- Given a rod of length n inches and an array of prices that contains prices of all pieces different pieces are given as following, then the maximum obtainable value is 22 (by of size smaller than n. Determine the maximum value obtainable by cutting up the rod and selling the pieces. For example, if length of the rod is 8 and the values of cutting in two pieces of lengths 2 and 6) S.

2022-23 Batch

arithmetic operations needed to compute the product, or the efficiency (using matrix The order in which we parenthesize the product affects the number of simple chain multiplication) က

## EXPERIMENT-9: Title: DYNAMIC PROGRAMMING-II

- 1. Implement Floyd's algorithm for the All-Pairs-Shortest-Paths problem.
- 2. Compute the transitive closure of a given directed graph using Warshall's algorithm
- 3. Given two sequences, find the length of longest subsequence present in both of them. A subsequence is a sequence that appears in the same relative order, but not necessarily contiguous. For example, "abc", "abg", "bdf", "aeg", "acefg" etc are subsequences of "abcdefg".

# EXPERIMENT-10: Title: SORTING IN LINEAR TIME LOWER BOUNDS

- 1. Write a program to perform count sort
- 2. Write a program to perform radix sort

### EXPERIMENT-11: Title: BACKTRACKING

- 1. Find a subset of a given set  $S = \{s_1, s_2, ...., s_n\}$  of n positive integers whose sum is equal to a given positive integer d. For example, if  $S = \{1, 2, 5, 6, 8\}$  and d = 9 there are two solutions(1,2,6)and(1,8).A suitable message is to be displayed if the given problem instance doesn't have a solution.
- Implement N Queen's problem using Back Tracking. o ...
  - Implementation of GRAPH COLORING
- Implement Sudoku problem 4.
- 5. Implement the Hamilton cycle problem.

EXPERIMENT-12: Title: Branch and Bound B.TECH (CSE) with Specialization in Specialization in DevOps

# UNIVERSITY OF PETROLEUM & ENERGY STUDIES 2022-23 Batch

- implement the 1/0 knapsack problem using branch and bound
  - The Hamiltonian cycle problem is NP-complete.
  - The sum of subset problem using NP-complete. **છ** છે
